Stories

Brainstorm and write down some of the experiences that you've had while learning how to code. Think about problems you've solved, bugs you've figured out, and concepts you've learned. Write or type them all out – even ones you don't think could turn into a good story.

Brainstorming Ideas

1. I liked the planning stages
2. When SQL clicked for me more than other languages
3. When I felt that I couldn't do this bootcamp and had a meltdown
4. When I thought that I wouldn't like QA because everyone was dogging it but then I ended up liking it.

Stories

1. I remember when I was first introduced to SQL, it just clicked. I remember that learning Javascript and python were a little rough and the concepts were hard to grasp at times. But SQL just clicked and sparked my interest in data analytics. I would love to learn more about python in the future and build projects centered around SQL and python.
2.
3. When we were about to dive into learning about quality assurance, nobody was a fan. I heard a lot of "I don't like it because it's not traditional coding" and "it's boring". So going into quality assurance, I was not excited. I was actually dreading it. But once I started grasping the concepts of it, I realized 1. How important QA actually is for any company and 2. That I genuinely enjoy the non coding side of software engineering as much as the coding.
